ProjectName	**Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer**
Maximum Marks	3 Marks

Ideation Diagram

Ideation Overview

The project ideation is based on the identified difficulty in the standard laptop procurement process. The source project states that the current process lacks efficiency and automation, and that standard laptop requests require configuration that can be subject to oversight or delay. The ideation therefore focuses on reducing manual overhead and improving the allocation of configuration work.

Problem-to-Idea Mapping

The proposed idea is to automate the workflow using ServiceNow Flow Designer. The Standard Laptop Service Catalog request is connected to an approval process, after which the automation creates the required Catalog Task. The task is configured for the Hardware assignment group, creating a direct link between an approved laptop request and the configuration activity.

Main Ideation Elements

- Identify delays and manual overhead in standard laptop procurement.
- Provide a streamlined process for standard laptop requests.
- Automatically generate configuration tasks after approval.
- Assign the generated task to the Hardware team.
- Reduce manual intervention and improve procurement efficiency.

IDEATION PROCESS AND PROPOSED WORKFLOW

1. Problem Identification

The source project identifies inefficiency, manual overhead, and possible delays in standard laptop procurement. A configuration activity is required, but without automation this activity may be overlooked or delayed. This can increase user waiting time and affect resource utilisation.

Ideation Diagram

2. User Need

The user story describes the need from the IT procurement team perspective: standard laptop orders should follow a streamlined process in which tasks are automatically generated and assigned to the hardware team for configuration. The intended result is prompt configuration with less manual intervention.

3. Proposed Automation Idea

The project creates a Flow Designer flow named “Standard laptop task.” A Service Catalog trigger starts the process. The flow uses the Create Catalog Task action and the Requested Item record. The task is configured with the short description “Laptop need to Configured,” Assignment group “Hardware,” and Approval “Approved.”

4. Service Catalog Integration

The completed flow is assigned to the Standard Laptop Service Catalog item through the Process Engine configuration. A user can then select Standard Laptop from the Service Catalog and place an order. After approval, the flow executes and creates the Catalog Task associated with the Requested Item.

5. Expected Result

- Timely creation of the laptop configuration task.
- Automatic assignment of the task to Hardware.
- Reduced manual intervention and potential errors.
- Improved resource utilisation within the IT department.
- A more efficient and seamless standard laptop procurement process.

Ideation Flow

Standard Laptop Order → Service Catalog → Approval → Flow Designer → Create Catalog Task → Assignment Group: Hardware → Laptop Configuration. This flow represents the core idea developed from the problem and user story in the uploaded project document.

Conclusion

The ideation transforms the identified procurement problem into a Flow Designer-based automation solution. By connecting the Standard Laptop Service Catalog item with approval and automatic Catalog Task creation, the proposed approach addresses the manual effort and delays described in the project.
