ProjectName	**Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer**
Maximum Marks	3 Marks

DATA FLOW DIAGRAM (DFD)

DFD Overview

The DFD shows how information moves through the automated Standard Laptop procurement process. The requester submits a Standard Laptop order through the Service Catalog. The request moves to approval and then into the Flow Designer process, which uses the Requested Item to create a Catalog Task.

Major Data Flows

- Requester data flows into the Standard Laptop Service Catalog request.
- The request is passed to the approval process.
- The approved condition activates the Service Catalog-triggered flow.
- The Requested Item record is used to create the Catalog Task.
- The generated task is assigned to the Hardware group for configuration.

DFD PROCESS DESCRIPTION

Level 0 – Procurement Request

At the highest level, the requester provides the Standard Laptop order through the Service Catalog. The system stores and processes the request before it reaches the approval stage.

Level 1 – Automation

After approval, the Service Catalog trigger starts the “Standard laptop task” Flow Designer flow. The flow executes the Create Catalog Task action using the Requested Item record.

Task Data

The generated Catalog Task receives the short description “Laptop need to Configured,” the Hardware assignment group, and the Approved condition specified in the project.

Output

The final output of the data flow is an operational Catalog Task that can be processed by the Hardware team to configure the standard laptop.

Conclusion

The DFD demonstrates the project's central automation path from request input to task output and shows how Flow Designer reduces manual task creation and allocation.
