ProjectName	**Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer**
Maximum Marks	3 Marks

USE CASE DIAGRAM

Use Case Overview

The use case model represents the Standard Laptop procurement workflow documented in the project. The requester selects the Standard Laptop item and places the order. The request then passes through approval, after which the Flow Designer automation creates the Catalog Task. The Hardware Team receives the generated task for laptop configuration.

Primary Actors and Use Cases

- Requester – selects the Standard Laptop item and places the order.
- Approver – processes the approval associated with the request.
- Flow Designer / System User – executes the configured automation.
- Hardware Team – receives and processes the generated Catalog Task.

USE CASE DESCRIPTION

Requester Use Case

The requester accesses the Service Catalog, selects Standard Laptop under the Hardware category, and places the order. The project documentation explicitly describes this ordering sequence.

Approval Use Case

The submitted request is opened and the Approvers section is used to process the approval. The project specifies Approved as the approval value used by the flow action.

Automation Use Case

The Flow Designer flow named “Standard laptop task” uses a Service Catalog trigger and a Create Catalog Task action. The Requested Item record is supplied to the action.

Hardware Fulfilment Use Case

After the flow creates the Catalog Task, the task is assigned to the Hardware group and contains the configured short description. This task represents the laptop configuration activity.

Expected Outcome

The use case sequence provides a direct path from a Standard Laptop order to an approved and automatically generated configuration task, reducing manual intervention and supporting timely fulfilment.
